#### **Overview**

Introduction

Essential operations

Linear curve fitting

Regularization

# Introduction

## Motivating linear algebra

Même le feu est régi par les nombres.

Fourier<sup>1</sup> studied the transmission of heat using tools that would later be called an eigenvector-basis. Why would he say something like this?

<sup>&</sup>lt;sup>1</sup>Jean Baptiste Joseph Fourier (1768-1830)

#### **Matrices**

 $\mathbf{A} \in \mathbb{R}^{m,n}$  is a real-valued Matrix with m rows and n columns.

$$\mathbf{A} = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{pmatrix}, a_{ij} \in \mathbb{R}.$$
 (1)

3

# **Essential operations**

#### **Addition**

To matrices  $\mathbf{A} \in \mathbf{R}^{m,n}$  and  $\mathbf{B} \in \mathbf{R}^{m,n}$  can be added by adding their elements.

$$\mathbf{A} + \mathbf{B} = \begin{pmatrix} a_{11} + b_{11} & a_{12} + b_{12} & \dots & a_{1n} + b_{1n} \\ a_{21} + b_{21} & a_{22} + b_{22} & \dots & a_{2n} + b_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} + b_{m1} & a_{m2} + b_{m2} & \dots & a_{mn} + b_{mn} \end{pmatrix}$$
(2)

4

#### Multiplication

Multiply  $\mathbf{A} \in \mathbb{R}^{m,n}$  by  $\mathbf{B} \in \mathbb{R}^{n,p}$  produces  $\mathbf{C} \in \mathbb{R}^{m,p}$ ,

$$\mathbf{AB} = \mathbf{C}.\tag{3}$$

To compute C the elements in the rows of A are multiplied with the column elements of C and the products added,

$$c_{ik} = \sum_{j=1}^{m} a_{ij} \cdot b_{jk}. \tag{4}$$

# Linear Algebra for Machine Learning in Python —Essential operations

└─Multiplication

#### Define on the board:

- Dot product  $\mathbf{a} \cdot \mathbf{b} = a_1 b_1 + a_2 b_2 + \cdots + a_n b_n$  for two vectors  $\mathbf{a}, \mathbf{b} \in \mathbb{R}^n$ .
- Row times column view [Str+09]:

# The identity matrix

$$\mathbf{I} = \begin{pmatrix} 1 & & & \\ & 1 & & \\ & & \ddots & \\ & & & 1 \end{pmatrix} \tag{5}$$

Demonstrate multiplication with the inverse by hand. TODO

#### Matrix inverse

The inverse Matrix  $\mathbf{A}^{-1}$  undoes the effects of  $\mathbf{A}$ , or in mathematical notation,

$$\mathbf{A}\mathbf{A}^{-1} = \mathbf{I}.\tag{6}$$

The process of computing the inverse is called gaussian elimination.

# Linear Algebra for Machine Learning in Python

Essential operations

└─Matrix inverse

The inverse Matrix  $A^{-1}$  undoes the effects of A, or in mathematical notation,  $\Delta A^{-1} = 1$ 

Matrix inverse

The process of computing the inverse is called gaussian elimination.

#### Example on the board:

$$\mathbf{A} = \begin{pmatrix} 2 & 0 \\ 1 & 3 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 2 & 0 & 1 & 0 \\ 1 & 3 & 0 & 1 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 1 & 0 & \frac{1}{2} & 0 \\ 1 & 3 & 0 & 1 \end{pmatrix} \tag{7}$$

$$\rightsquigarrow \begin{pmatrix} 1 & 0 & \frac{1}{2} & 0 \\ 0 & 3 & -\frac{1}{2} & 1 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 1 & 0 & \frac{1}{2} & 0 \\ 0 & 1 & -\frac{1}{6} & \frac{1}{3} \end{pmatrix} \tag{8}$$

Test the result:

$$\begin{pmatrix} 2 & 0 \\ 1 & 3 \end{pmatrix} \begin{pmatrix} \frac{1}{2} & 0 \\ -\frac{1}{6} & \frac{1}{3} \end{pmatrix} = \begin{pmatrix} 2 \cdot \frac{1}{2} + 0 \cdot -\frac{1}{6} & 2 \cdot 0 + 0 \cdot \frac{1}{3} \\ 1 \cdot \frac{1}{2} + 3 \cdot -\frac{1}{6} & 0 \cdot 0 + 3 \cdot \frac{1}{3} \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$
(9)

#### The Transpose

The transpose operation flips matrices along the diagonal, for example in  $\mathbb{R}^2$ ,

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix}^T = \begin{pmatrix} a & c \\ b & d \end{pmatrix}$$
 (10)

#### Motivation of the determinant

TODO

#### Computing determinants in two or three dimensions

The two dimensional case:

$$\begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11} \cdot a_{22} - a_{12} \cdot a_{21} \tag{11}$$

(12)

Computing the determinant of a three dimensional matrix.

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11} \cdot \begin{vmatrix} a_{21} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{21} \cdot \begin{vmatrix} a_{12} & a_{13} \\ a_{32} & a_{33} \end{vmatrix} + a_{31} \cdot \begin{vmatrix} a_{12} & a_{13} \\ a_{22} & a_{23} \end{vmatrix}$$

$$(13)$$

Linear Algebra for Machine Learning in Python

—Essential operations

Computing determinants in two or three dimensions

Computing distriminants in two or three dimensions. The two dimensional case:  $\begin{vmatrix} z_1 & z_2 \end{vmatrix} = z_1 \cdot z_2 - z_1 \cdot z_2 - z_2 \cdot z_1 \qquad (11)$  (22) Computing the determinant of a three dimensional matrix.  $\begin{vmatrix} z_1 & z_2 \end{vmatrix} = z_1 \cdot z_2 \cdot z_2 - z_2 \cdot z_1 \qquad z_2 \cdot z_2 \cdot z_2$  (23)  $\begin{vmatrix} z_1 & z_2 \\ z_1 & z_2 & z_2 \end{vmatrix} = z_1 \cdot \begin{vmatrix} z_2 & z_2 \\ z_2 & z_2 \end{vmatrix} - z_2 \cdot \begin{vmatrix} z_2 & z_1 \\ z_2 & z_2 \end{vmatrix} + z_2 \cdot z_2 \begin{vmatrix} z_2 & z_1 \\ z_2 & z_2 \end{vmatrix} = z_2 \cdot z_2$  (33)

(14)

Draw the sign pattern on the board:

The determinant can be expandend along any column as long as the sign pattern is respected.

#### **Determinants in n-dimensions**

$$\begin{vmatrix} a_{11} & a_{21} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{vmatrix} = a_{11} \begin{vmatrix} a_{22} & \dots & a_{2n} \\ \vdots & & \vdots \\ a_{m2} & \dots & a_{mn} \end{vmatrix} + a_{21} \begin{vmatrix} a_{21} & \dots & a_{2n} \\ \vdots & & \vdots \\ a_{m2} & \dots & a_{mn} \end{vmatrix}$$

$$-a_{m1}\begin{vmatrix} a_{11} & \dots & a_{1n} \\ a_{21} & \dots & a_{2n} \\ \vdots & & \vdots \end{vmatrix}$$

# Linear curve fitting

#### What is the best line connecting measurements?

#### **Problem Formulation**

A line has the form cx + d, with  $c, x, d \in \mathbb{R}$ . In matrix language we could ask for every point to be on the line,

$$\begin{pmatrix} 1 & x_1 \\ 1 & x_2 \\ 1 & x_3 \\ \vdots & \vdots \\ 1 & x_n \end{pmatrix} \begin{pmatrix} c \\ d \end{pmatrix} = \begin{pmatrix} p_1 \\ p_2 \\ \vdots \\ p_n \end{pmatrix}. \tag{15}$$

We can treat polynomials as vectors, too! The coordinates populate the matrix rows in  $\mathbf{A} \in \mathbb{R}^{n_p \times 2}$ , and the coefficients appear in  $\mathbf{x} \in \mathbb{R}^2$ , with the points we would like to model in  $\mathbf{b} \in \mathbb{R}^{n_p}$ . The problem now appears in matrix form and can be solved using linear algebra!

# The Pseudoinverse [Str+09; DFO20]

The inverse we saw earlier only exsits for sqaure that is n by n matrices. Nonsqaure  $\mathbf{A}$  such as the one we just saw, require the pseudoinverse,

$$\mathbf{A}^{\dagger} = (\mathbf{A}^{T} \mathbf{A})^{-1} \mathbf{A}^{T}. \tag{16}$$

Sometimes solving  $\mathbf{A}\mathbf{x} + \mathbf{b} = 0$  is implossible, the pseudoinverse considers,

$$\min_{\mathbf{x}} \frac{1}{2} |\mathbf{A}\mathbf{x} - \mathbf{b}|^2 \tag{17}$$

(18)

instead.  $\mathbf{A}^{\dagger}\mathbf{b} = \mathbf{x}$  yields the solution.

 $\min_{\mathbf{a}} \frac{1}{2} |\mathbf{A}\mathbf{x} - \mathbf{b}|^2$ 

 $(\mathbf{A}^T\mathbf{A})^{-1}\mathbf{A}^T\mathbf{b} = \mathbf{x}$ 

$$0 = \nabla_x \frac{1}{2} |\mathbf{A}\mathbf{x} - \mathbf{b}|^2$$

 $= (\mathbf{A}\mathbf{x} - \mathbf{b})\mathbf{A}^T$ 

 $\mathbf{A}^T \mathbf{h} = \mathbf{A}^T \mathbf{A} \mathbf{x}$ 

 $= \mathbf{\Delta}^T \mathbf{\Delta} \mathbf{x} - \mathbf{\Delta}^T \mathbf{h}$ 

 $= \nabla_{\mathbf{x}} \frac{1}{2} (\mathbf{A}\mathbf{x} - \mathbf{b})^T (\mathbf{A}\mathbf{x} - \mathbf{b})$ 

(24)

(25)

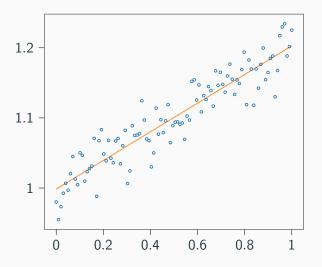

(26)

The Pseudoinverse [Str+09; DFO20

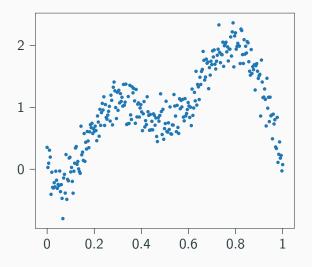

The Pseudoinverse [Str+09; DFO20]

Sometimes solving 
$$\mathbf{A}\mathbf{x} + \mathbf{b} = 0$$
 is implossible. One the board, derive:

# **Linear regression**

# What about harder problems?

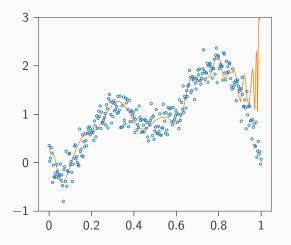

#### Fitting higher oder polynomials

$$\underbrace{\begin{pmatrix}
1 & x_1^1 & x_1^2 & \dots & x_1^m \\
1 & x_2^1 & x_2^2 & \dots & x_2^m \\
1 & x_3^1 & x_3^2 & \dots & x_3^m \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
1 & x_n^1 & x_n^2 & \dots & x_n^m
\end{pmatrix}}_{\mathbf{A}} \underbrace{\begin{pmatrix}
c_1 \\ c_2 \\ \vdots \\ c_m
\end{pmatrix}}_{\mathbf{x}} = \underbrace{\begin{pmatrix}
p_1 \\ p_2 \\ \vdots \\ p_n
\end{pmatrix}}_{\mathbf{b}}.$$
(27)

As we saw for the linear regression  $\mathbf{A}^{\dagger}\mathbf{b} = \mathbf{x}$  gives us the coefficients.

#### Overfitting

Below the solution for a polynomial of 7th degree, that is m = 7.

The noise took over! What now?

# Regularization

#### Motivation

• Is there a way to fix the previous example?

## Eigenvalue-Decomposition [Str+09]

Eigenvalues let us look into the heart of a sqaure system-matrix  $\mathbf{A} \in \mathbb{R}^{n,n}$ .

$$\mathbf{A} = \mathbf{S} \begin{pmatrix} \lambda_1 & & & \\ & \lambda_2 & & \\ & & \ddots & \\ & & & \lambda_n \end{pmatrix} \mathbf{S}^{-1} = \mathbf{S} \wedge \mathbf{S}^{-1}$$
 (28)

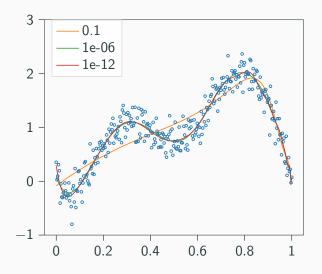

# **Computing the Decomposition**

# Singular-Value-Decomposition [Str+09]

Dealing with matrices which aren't sqaure:

$$\mathbf{A} = \mathbf{U} \mathbf{\Sigma} \mathbf{V}^T \tag{29}$$

# Regularized solution

#### **Conclusion**

• True scientists know what linear can do for them!
